ALMOST ALTERNATING KNOTS WITH 12 CROSSINGS AND TURAEV GENUS

SLAVIK JABLAN

ABSTRACT. Among non-alternating knots with $n \leq 12$ crossings given in [1] Turaev genus is not known for 191 knot. For 154 of them we show that they are almost alternating, so their Turaev genus is 1.

Almost alternating knots are defined in [2]:

Definition 0.1. *A diagram D of a knot K in the 3-sphere is almost alternating if one crossing change makes the diagram alternating. A knot K is almost alternating if K has an almost alternating diagram and K does not have an alternating diagram.*

In [2] the authors proved that all knots with at most $n = 11$ crossings, except knots $K11n95 = 2\,0.-2\,-1.-2\,0.2$, $K11n118 = 2\,0.-3.-2\,0.2$, and $K11n183 = 9^*.-2:.-2$ are almost alternating. For the knot $K11n183$ with the minimal DT code $\{\{11\},\{6,-14,10,-18,2,22,20,-4,12,-8,16\}\}$, in the book [3] is shown that it is almost alternating, because it has almost alternating representation $8^*2\,0.2\,0.-1.2\,0.2\,0$, with the DT code $\{\{12\},\{-6,10,22,18,2,16,24,20,8,12,4,14\}\}$, and the status of the remaining two knots, $K11n95$ and $K11n118$ is still undetermined.

To a knot diagram D, Turaev associated a closed orientable surface embedded in S^3, called the Turaev surface. The Turaev genus $g_T(K)$ of a knot K is first defined in [4], as the minimal number of the genera of the Turaev surfaces of diagrams of K. We cite the description of Turaev surface and the definition of Turaev genus from [5].

Every knot diagram D has an associated Turaev surface ΣD constructed as follows. Think of the diagram D as a subset of S^2, which itself is a subset of S^3. Replace the crossings of D with saddles so that the A-smoothing lies on one side of S^2 and the B-smoothing lies on the other side of S^2. Replace the arcs of D not near crossings with bands orthogonal to S^2. The resulting surface is a cobordism between the all-A Kauffman state and the all-B Kauffman state. The Turaev surface ΣD is obtained by capping off the boundary components of this cobordism with disks.

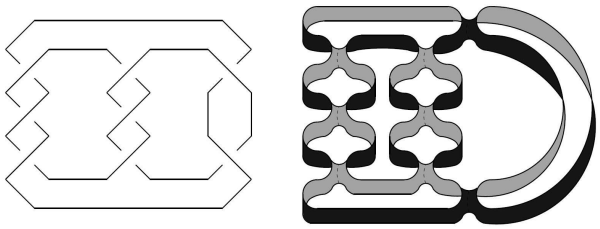

FIGURE 1. Diagram of the knot $8_{19} = 3, 3, -2$ and its corresponding Turaev surface [5].

Definition 0.2. *The Turaev genus of a knot K, denoted $g_T(K)$, is defined as $g_T(K) = min\{g(\Sigma D) \mid$ D is a diagram of $K\}$.*

For every alternating knot, its Turaev genus is 0, and for every almost alternating knot it is 1 [6].

Since every almost alternating knot K has the Turaev genus $g_T(K) = 1$, Turaev genus is known and equal to 1 for all non-alternating knots with at most $n = 11$ crossings, except $K11n95$ and $K11n118$, for which is unknown. These results are given in the *Knot Info* (`http://www.indiana.edu/~knotinfo/`) by C. Livingston and J. C Cha [1].

All knots in this paper are given by their *Knotscape* symbol and in the Conway notation, where for knots derived from basic polyhedra is used notation from the program *LinKnot* `http://math.ict.edu.rs/`, which is used for all computations. Knots are also given by their DT-codes.

For the computations we used two methods: replacement of rational tangles with equivalent rational tangles with exactly one -1 elementary tangle, and the derivation of "source links" [1] with exactly one -1 tangle and their extension to larger almost alternating knots.

Looking for Turaev genus of non-alternating knots with $n \leq 12$ crossings in the *Knot Info* [1] we conclude that it is unknown for 191 knot. From them, we succeeded to show that 154 knots are almost alternating by finding their explicit almost alternating representations. These knots are given in the first two tables, and for all of them Turaev genus is equal to 1. For the remaining 35 non-alternating knots with $n = 12$ crossings their Turaev genus is still unknown.

[1] A link in the Conway notation containing only tangles ± 1 and ± 2 is called source link. Other links belonging to its family are obtained by substituting twists ± 2 by larger twists.

$K12n882$	$\{\{12\},\{6,-20,-12,16,18,-4,22,24,8,-2,-10,14\}\}$	$\{\{13\},\{4,12,-10,16,24,2,20,22,8,26,14,6,18\}\}$

For the remaining 35 non-alternating knots it is not known that they are almost alternating or not, so we don't know that their Turaev genus is 1 or greater than 1. These knots are given in the following table:

$K12n253$	$2:(2,-2\ -1)\,0:-20$
$K12n254$	$2:(-2,21)\,0:-20$
$K12n280$	$2.-20.-2.2110$
$K12n285$	$8^*-2\ -1\ -1::-20$
$K12n318$	$20.-2\ -1.-20.30$
$K12n323$	$3.-2\ -10.-2.20$
$K12n328$	$20.-2\ -1.-20.210$
$K12n356$	$8^*-2\ -1.20.-2$
$K12n358$	$2.-30.-2\ -1.20$
$K12n370$	$-2\ -10.-2\ -1.-20.20$
$K12n371$	$210.-2\ -1.-20.20$
$K12n375$	$2.2.-2.20.-2\ -1$
$K12n407$	$8^*2:.-20:.-2\ -10$
$K12n426$	$8^*-2\ -1::-2\ -1$
$K12n439$	$8^*-3::-2\ -1$
$K12n443$	$8^*-2\ -1::-30$
$K12n451$	$8^*2:.-2\ -10:.-20$
$K12n452$	$3.-20.-2.210$
$K12n462$	$8^*-20.2:-2\ -10$
$K12n487$	$210.-2.-20.30$
$K12n488$	$-2\ -10.-2.-20.30$
$K12n591$	$30.-2\ -1.-20.20$
$K12n706$	$101^*-20::.-20$
$K12n729$	$102^*-20::-2$
$K12n730$	$8^*-2.2.-20:20$
$K12n749$	$-2.2.-2.2.3$
$K12n750$	$2.2.-2.2.-3$
$K12n801$	$8^*20.-2.-1.-20.20$
$K12n807$	$8^*-20:-20:-20:20$
$K12n809$	$8^*-20:20:-20:20$
$K12n811$	$9^*.-2:-20.-2$
$K12n830$	$-2.2.-3.2.2$
$K12n835$	$8^*20.-20.-1.-20.20$
$K12n838$	$-2.-2.-20.2.2.20$
$K12n873$	$8^*20.-20.-20.20$
